**Cover:** Morphological comparison of subcutaneous (SC) and orthotopic (ORT) inoculation of OE19 (adenocarcinoma of the gastroesophageal junction). At low magnification, bar = 4,000  $\mu\text{m}$ ; in others, bar = 500  $\mu\text{m}$ . The SC tumors were well circumscribed from the adjacent tissue, with scant stroma and the formation of large ductal structures. In contrast, the ORT tumors were less circumscribed, with small ductal structures invading into abundant stroma. (See K Nakano, *et al.* p 293–300)
